Welcome,

Our families would like to invite you to our 48th Annual Production Sale. Thank you to all our customers, past, present and future. We are blessed to have support from our entire family and from all of the cattlemen and their families in our bull and female sales over the past 48 years! We look forward to serving you today and in the future.

We are offering a great set of bulls in 2025...maybe our best. They have tremendous quality throughout the entire offering. We strive to produce cattle that will perform, stay sound and continue to be productive in your environment. Our cow herd is culled very rigidly...demanding good structure, sound hoof structure, fertility and quiet disposition. The mother cow is very important in our operation along with herd sires that exemplify these qualities.

The sale bulls were not creep fed and have been developed slowly to ensure long use and soundness for our customers. It is very gratifying to hear of bulls still being used six to eight years in a program.

The offering represents a complete test from birth to sale day. Hereford bulls are either polled or dehorned (horn gene) and some may have the scurred gene. The Angus bulls are deep in quality and tremendous in disposition. All bulls will be semen tested, neck implanted for foot rot and pink eye along with complete breeding exam by Dr. Holly Johnson of Hosmer Vet Clinic.

Join us for lunch on April 11, 2025 at the ranch for our 48th production sale. The bulls will be penned for your viewing the morning of the sale and will be sold by video auction. Feel free to look at the offering any time before the sale.

Thank you for your friendship, patronage and interest in our program. See you on Friday, April 11, 2025 at the ranch.

The Thorstenson Hereford Ranch

Sired by 25L and out of one of our best cow families. Thor is a sire that is better than breed average in many measureable traits and is a trait leader in four different traits. This unique tabulation puts him in a category of only a few select sires in AHA. His sons and daughters indexed the highest in our herd of the sires we used. 403 daughters across the US. Co-owned with Frederickson Ranch and ABS.

EXPLANATION OF HEREFORD EPDS

2023 HEREFORD BREED AVERAGE EPDS

BW	WW	YW	Milk	M&G	Fat	REA	Marb.	CHB
2.6	56	90	27	55	0.022	0.47	0.14	\$122

BIRTH WEIGHT (BW):

BW EPD is an indicator trait for calving ease and is measured in pounds. For example, if sire A has a BW EPD of 3.6 and sire B has a BW EPD of 0.6, then you would expect on average if comparably mated, sire A's calves would come 3 lb. heavier at birth when compared to sire B's calves. Larger BW EPDs usually, but not always, indicate more calving difficulty. The figure in parentheses found after each EPD is an accuracy value or reliability of the EPD.

WEANING WEIGHT (WW):

WW EPD is an estimate of pre-weaning growth that is measured in pounds. For example, if sire A has a WW EPD of 60 and sire B has a WW EPD of 40, then you would expect on average if comparably mated, sire A's calves would weigh 20 lb. heavier at weaning when compared to sire B's calves.

YEARLING WEIGHT (YW):

YW EPD is an estimate of post-weaning growth that is measured in pounds. For example, if sire A has a YW EPD of 100 and sire B has a YW EPD of 70, then you would expect on average if comparably mated, sire A's calves would weigh 30 lb. heavier at a year of age when compared to sire B's calves.

MATERNAL MILK (M):

The milking ability of a sire's daughters is expressed in pounds of calf weaned. It predicts the difference in average weaning weights of sires' daughters' progeny due to milking ability. Daughters of the sire with a +14 MM EPD should produce progeny with 205-day weights averaging 24 lb. more (as a result of greater milk production) than daughters of a bull with a MM EPD of -10 lb. (14 minus -10.0 = 24 lb.). This difference in weaning weight is due to total milk production during the entire lactation.

MATERNAL MILK & GROWTH (M&G):

Maternal Milk & Growth reflects what the sire is expected to transmit to his daughters for a combination of growth genetics through weaning and genetics for milking ability. It is an estimate of daughters' progeny weaning weight. A bull with a 29 lb. M&G EPD should sire daughters with progeny weaning weights averaging 19 lb. heavier than progeny of a bull's daughters with a M&G EPD of 10 lb. (29 minus 10 = 19 lb.). It is equal to one-half the sire's weaning weight EPD, plus all of his MM EPD. No accuracy is associated with this since it is simply a mathematical combination of two other EPDs. It is sometimes referred to as "total maternal" or "combined maternal."

RIB FAT (FAT):

The FAT EPD reflects differences in adjusted 365-day, 12th-rib fat thickness based on carcass measurements of harvested cattle. Sires with low, or negative FAT EPDs are expected to produce leaner progeny than sires with higher EPDs. Ultrasound measures are also incorporated into this trait and have been shown to be highly correlated with the performance of slaughter progeny. All data is expressed on a carcass scale.

RIBEYE AREA (REA):

REA EPDs reflect differences in an adjusted 365-day ribeye area measurement based on carcass measurements of harvested cattle. Sires with relatively higher REA EPDs are expected to produce better-muscled and higher percentage yielding slaughter progeny than will sires with lower REA EPDs. Ultrasound measurements are also incorporated into this trait and have been shown to be highly correlated with the performance of slaughter progeny. All data is expressed on a carcass scale.

MARBLING (MRB):

MARB EPDs reflect differences in an adjusted 365-day marbling score (intramuscular fat, [IMF]) based on carcass measurements of harvested cattle. Breeding cattle with higher MARB EPDs should produce slaughter progeny with a higher degree of IMF and therefore higher quality grades. Ultrasound measurements are also incorporated into this trait and have been shown to be highly correlated with the performance of slaughter progeny. All data is expressed on a carcass scale.

CERTIFIED HEREFORD BEEF (CHB\$):

The Certified Hereford Beef Index is a terminal sire index that is built on a production system where Hereford bulls are mated to mature commercial Angus cows and all progeny will be targeted for Certified Hereford Beef after the finishing phase. This index has significant weight on Carcass Weight to ensure profit on the rail. As well there is a positive weighting for Average Daily Gain along with a negative weighting on Dry Matter Intake to ensure efficient pounds of growth in the finishing phase. Keep in mind, this production system takes advantage of complimentary breeding with the commercial Angus cow. Although Marbling is weighted positively in this index, a positive weighting for Rib-eye Area and a negative weighting for Back Fat are a greater priority in this index to allow for optimum end-product merit. This is the only index that has no emphasis on fertility. Remember that no replacement heifers are being retained.
